Reinforcement Learning | Post-Training | Evaluation

Profile

Research scientist with a Ph.D. in reinforcement learning studying policy improvement when the model or evaluator is imperfect. My work spans robust MDPs under model uncertainty, recurrent value evaluators with verifier-style feedback, and production experimentation systems for measurement correctness and reliability. Current interests include RL post-training, reasoning, long-horizon agents, and reliable tool-use decisions under uncertainty.

Experience

2022–Present **Research Scientist**, *Meta*

- Build production systems for experiment-metric correctness and ML auditing in large-scale ads experimentation.
- Develop anomaly and data-quality monitoring together with statistical diagnostics for unreliable, biased, stale, or inconsistent signals.
- Translate failure analyses into monitoring and correctness safeguards for production experimentation systems.

2018 **AI Engineer Intern**, *Envio, Inc.*, Dover, NH

- Developed learning-based methods for vehicle routing and scheduling under operational constraints and uncertain execution.

Selected Research

Policy Improvement with Imperfect Evaluators

Finite-Reference Error Bounds for Recurrent Value Evaluators in Policy Improvement (UPI-TRM); earlier version at ICLR 2026 Workshop on AI with Recursive Self-Improvement

Co-developed finite-depth error bounds for recurrent value evaluators used in policy improvement without assuming recurrent convergence, separating endpoint discrepancy from Bellman-residual error. Connected centered advantage error to conservative policy-improvement bounds and evaluated the analysis on an exact finite MDP and a fixed Sudoku census.

Robust and Risk-Sensitive Markov Decision Processes

NeurIPS 2021 and AISTATS 2021

Developed scalable algorithms for L_∞ -constrained S-rectangular robust MDPs and percentile criteria under model uncertainty.

Technical Skills

Programming: Python, PyTorch.

Evaluation and experimentation: experiment-metric correctness, statistical diagnostics, anomaly and data-quality monitoring, ML auditing.

RL and post-training: robust MDPs, policy improvement, verifier-style rewards and RL with verifiable rewards; hands-on PPO and DPO experiments on small arithmetic language models; working knowledge of GRPO and reward modeling.

Selected Publications

UPI-TRM: Policy Improvement under Truncated Evaluators with Verifier-Style Rewards

Education

2015–2022 **Ph.D. in Computer Science**, *University of New Hampshire*

Dissertation: *Efficient Data-Driven Robust Policies for Reinforcement Learning* (advisor: Marek Petrik).

M.S. in Computer Science awarded en route (2018). Thesis: *Representation Learning for Reinforcement Learning via Singular Value Decomposition*.

2010–2013 **M.S. in Machine Automation**, *Tampere University*

Thesis: *Robot Localization under Partial Observability with Weak Maps*

Honors and Fellowships

CEPS Graduate Fellowship, University of New Hampshire

Thesis and Dissertation Fellowship, Tampere University of Technology
